# Electronic ballasts for fluorescent lamps

Fluorescent lamps cannot be connected directly to the power supply as they are unable to regulate power and would not strike. The ballast ensures that the lamp electrodes are preheated, suffice voltage is generated to strike the lamp and that the discharge current is controlled.

This function is achieved by both electromagnetic (conventional switchstart and low loss) and Electronic High frequency ballasts

Electronic ballasts operate fluorescent lamps with high-frequency voltages and currents (40–100 kHz). The starting voltage is generated internally (no starter required) and the power factor is > 0,95 (no capacitor required for correcting the reactive power).

Electronic ballasts start fluorescent lamps in accordance with two different starting principles:

## *Warm-start*

After a specific period in which the lamp electrodes are pre-heated, the lamp is ignited using a preset ignition voltage. warm-starting the lamp protects the fluorescent lamp cathode and allows for frequent switching cycles during the life of the lamp.

## *Cold-start*

The fluorescent lamp is started immediately (< 0,2 seconds) by directly applying the starting voltage. Cold-starting the lamp reduces the switching cycles of the lamp (2–3 cycles of operation per day)

Tridonic electronic ballasts are characterised as being:

- Economical
- Easy to use
- Reliable

## A high level of economy

### *Energy savings*

Electronic ballasts operate fluorescent lamps in the high-frequency range ( $\geq 42$  kHz). This increases the luminous flux of the lamp by approximately 10 % or put another way a 10 % reduction in lamp operating wattage will produce the same luminous flux.

Electronic ballasts have reduced power losses ( $\geq 10$  % of the lamp wattage)

Electronic ballasts have a reduced level of self-heating (a lower lamp temperature increases the efficiency of the lamp).

Savings of up to 30 % can be achieved by using electronic high frequency ballasts when compared to a conventional switch start ballasts (diagram showing energy savings).

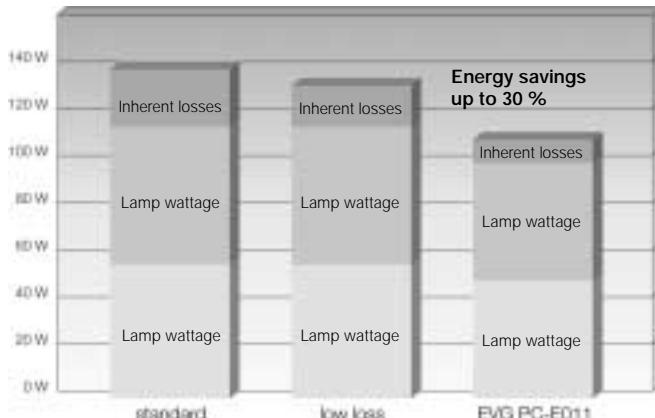

### *Longer service life of the lamp*

Electronic warm start ballasts increase the operating life of fluorescent lamps considerably when compared with a conventional switch start circuit.

Thus the costs of replacing the lamp and the maintenance costs for the lighting installation are reduced (maintenance intervals for the lighting installation become longer).

### *Disconnection of faulty lamps*

Electronic ballasts are able to identify faulty lamps and switch off the lamp. This avoids nuisance cycling of lamps at the end of their life and ensures no energy is wasted in repeated attempts to strike a faulty lamp. Once the lamp has been replaced, the lamp will start automatically.

Example: Operation of a 2 x 58 W lamp

### *Constant Power*

Electronic ballasts with constant power control guarantee optimum performance of the lamp regardless of fluctuations in mains voltage (198–254 V). This produces a constant luminous output and energy savings.

### *Suitable for emergency lighting*

Electronic ballasts can be operated with both AC and DC current. Therefore in cases where emergency lighting is required, there is no need to install a separate emergency lighting system (no additional investment costs).

### *Long service life*

Electronic ballasts from Tridonic are designed to have an average service life of 50 000 hours at their maximum permissible ambient temperature. This can only be achieved by using high-quality components, by configuring the circuit accordingly and by operating rigorous test programs.

### **Simple to use**

#### *Comfortable high quality lighting due to high frequency operation*

Electronic ballasts operate fluorescent lamps at a higher frequency (40–100 kHz) than mains power 50 Hz. The effects of this are all very positive: the gas discharge is more constant than with conventional ballasts which interrupt the lamp current at 50 Hz 100 times a second. The visible results of this constant gas discharge include:

- no cathode flickering (even at low temperatures)
- no stroboscopic effects (particularly important on rotating parts of machinery)

Overall improved visual comfort due to improved lighting quality.

#### *Comfortable lighting and a high level of quality due to ASIC light management*

Electronic ballasts from Tridonic are fitted with an integrated module specifically designed for Tridonic (ASIC) for the latest in lamp management.

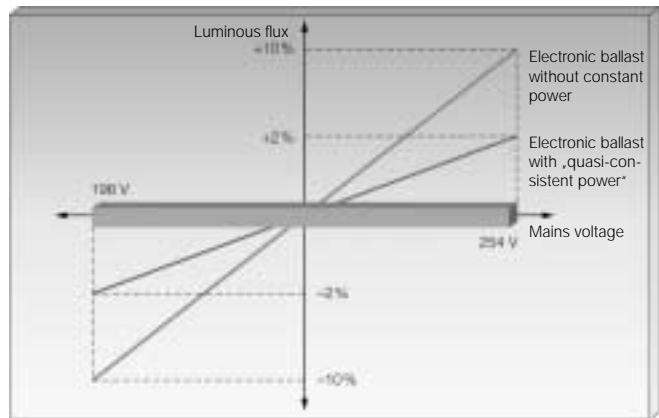

- The lamps start reliably without nuisance flickering or noise
- In the event of a fault, the lamp is switched off automatically without causing any further faults (flashing of faulty lamps)
- Safe shut down when the lamp comes to the end of its life

### *General comfort*

Electronic ballasts from Tridonic have an operating frequency of > 42 kHz and therefore do not interfere with IR remote control facilities (36 kHz).

Electronic ballasts are lightweight.

Electronic ballasts are fitted with an insulation displacement connector (IDC), which permits fast automatic and manual wiring (see page 15 for technical specifications).

PCE 011 consistent power output regardless of the mains voltage in the range 198 V to 254 V.

### **Safety, reliability and standards**

#### *Safety and standards*

Electronic ballasts from Tridonic comply with all European standards relating to safety, operation and EMC/immunity

EN 60928	General requirements and safety, alternating current AC
EN 60929	Operation, alternating current AC
EN 60924	General requirements and safety, direct current DC
EN 60925	Operation, direct current DC
EN 61000-3-2	Harmonic suppression
EN 61547	Immunity
EN 55015	Interference suppression < 30 MHz
EN 55022	Interference suppression > 30 MHz

can be used in emergency lighting installations in accordance with VDE 0108

ENEC tested

CE mark

#### *Tridonic Quality Assurance*

A full and comprehensive test program is carried out on 100 % of the goods produced by Tridonic in order to maintain the highest standards of reliability for all Tridonic devices.

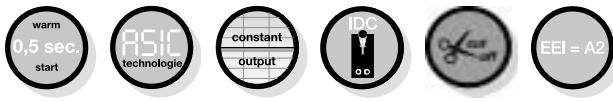

All components undertake a strict Thermal function test program based on all current standards and methods.

### **Lamp matrix**

#### *Which ballast for what lamp?*

You can obtain the current lamp matrix

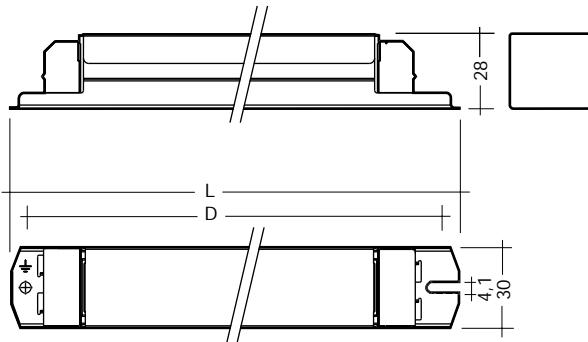

- via the Internet at [www.tridonic.com](http://www.tridonic.com) – FAQ

T5 16 mm

## Electronic ballasts T5, 16 mm Linear lamps

### PC T5 PRO 14-80 W 220-240 V 50/60/0 Hz

- lamp friendly warm start within 0,5 s
- cut off of filament heating (cut off technology)
- constant light output independent of fluctuations in mains voltage (198–254 V)
- AC voltage range 198–254 V
- DC voltage range 154–310 V (lamp start 200–310 V); battery voltage may drop briefly to 154 V, although ignition must be ≥ 198 V
- power factor > 0,95
- overvoltage protection 320 V AC, 1 h
- operating frequency ≥ 42 kHz

- suitable for automatic and manual wiring with insulation displacement connector (IDC)
- wide operating temperature range from -25°C to +60°C (50°C)
- suitable for use in emergency lighting installations in accordance with VDE 0108
- safe switch off of defective lamps
- automatic re-start after lamp change
- for luminaires with  $\nabla F$  and  $\nabla F \nabla F$  or  $\nabla M$  and  $\nabla M \nabla M$  in acc. with EN 60598, VDE 0710 and VDE 0711

Packaging:  
Box of 25  
28 boxes/pallet  
700 pieces/pallet

## Electronic ballasts Compact lamps TC-L

### PC PRO TC-L IDC 18-55 W 220-240 V 50/60/0 Hz

- lamp friendly warm start within 1,5 s
- constant light output independent of fluctuations in mains voltage (198–254 V)
- AC voltage range 198–254 V
- DC voltage range 176–280 V; battery voltage may drop briefly to 154 V, although ignition must be  $\geq$  198 V
- power factor > 0,95
- overvoltage protection 320 V AC, 1 h
- operating frequency  $\geq$  42 kHz
- suitable for automatic and manual wiring with insulation displacement connector (IDC)

- wide operating temperature range from -25°C to +60°C (50°C)
- suitable for use in emergency lighting installations in accordance with VDE 0108
- safe switch off of defective lamps
- automatic re-start after lamp change
- for luminaires with  $\triangle F$  and  $\triangle F/F$  or  $\triangle M$  and  $\triangle M/M$  in acc. with EN 60598, VDE 0710 and VDE 0711
- VDE EMV

## Technical Information

### IDC terminals

#### Why IDC terminals?

- fast manual and automatic wiring
- clear sight marks for accurate positioning
- 4,1 mm round fastening hole for accurate positioning

#### Terminal data

##### *Plug-in contact*

- suitable for rigid single-wire conductors, 0,5–1,5 mm<sup>2</sup>
- stripping length 7,5–8,5 mm
- wire removal tool, screwdriver, blade, 2,5 x 0,4 mm

##### *Insulation piercing contact*

- suitable for automatic wiring of rigid single-wire conductors, 0,5 mm<sup>2</sup>
- the conductor can only be loosened with force

#### Important!

Manually fastening the wire in this insulation piercing contact manually is not recommended!

The type of cable to be selected should be taken from the information provided by the wiring robot manufacturer.

# Magnetic chokes for fluorescent lamps

A choke is required to run a fluorescent lamp. This is a current limiting device which works on the self inductance principle. The impedance of the choke is set to match the arc voltage of the lamp which ensures that the correct current is supplied. In some cases a choke can be used for more than one lamp but the lamp should never be used with any other choke than the one specifically designed for the job. Also any supply voltage or frequency variation will affect the optimum performance of the choke, and hence the lamp, so the type with the correct values should always be used.

## Optimum performance

This is achieved by maintaining careful control of the main parameters.

### *Preheat current*

This is supplied to the cathodes prior to the striking voltage, without the correct preheat current the cathodes would be progressively damaged resulting in short lamp life. If the current is too high this is also the case.

### *Strike voltage*

In the case of a glow starter this is produced by the choke when the starter switch opens. The required voltage increases at high and low temperatures, and electronic starters may be required in abnormal temperature conditions.

For a fluorescent lamp to operate constantly the supply voltage must be at least twice the lamp voltage.

If it is less, then an auto transformer is required to step up the voltage.

### *Lamp current*

The tight tolerances used in manufacture ensure that the impedance is the correct value for the correct lamp current and hence lamp wattage and luminous flux.

## Minimum power losses

An inefficient choke means high losses, which in turn leads to high temperatures. This means the lamp runs out of its optimum temperature range and, in some cases, other components in the luminaire, such as capacitors, will also run too hot and fail prematurely.

Tridonic chokes are designed to ensure that losses are minimised by guaranteeing that the windings fill the bobbin, thereby optimising the dimensions of the choke and ensuring the correct amount of steel and copper per winding.

The losses (lamp and ballast) are rated in accordance with the ballast-lamp circuit (EEI) classification.

## Selection of the right choke

Generally there are 3 types of wound chokes available:

- Standard (EEI = C)
- Low loss (EEI = B2)
- Super low loss (EEI = B1)

Each version has the same impedance and provides the same lamp current. The difference is that the losses, and temperature rise, are progressively less, which can be seen from the data.

There are two reasons to select lower loss chokes:

### *Energy consumption*

A low loss choke typically consumes 30 % less power than a standard choke, and a super low loss uses 67 % less power than a standard choke.

### *Temperature rise*

A typical standard choke will increase in temperature by 55 K (Kelvin) above its surroundings, a low loss choke 35–40 K and a super low loss choke 25 K.

When considering dimensions, Tridonic chokes have optimised dimensions to minimise losses but lower loss chokes do have increased dimensions.

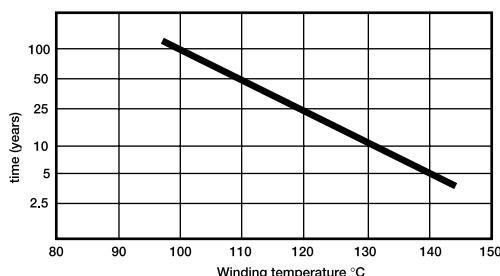

As the measured power consumption depends strongly on the method of measurement, differences up to 10 K are possible in the results.

## Maximum service life

Tridonic chokes use high quality class H insulation materials which are designed for temperatures above 180°C, thus ensuring maximum service life.

Long years of research and development have gone into the choice and selection of the right insulation materials, and the heat resistant properties of Tridonic products are far superior to the mandatory requirements.

The graph shows the theoretical service life of a choke against winding temperature. Every 10°C over the maximum winding temperature of 130°C ( $T_w = 130$ ) halves choke life. The expected length of life is based on 10 years continuous operation with a winding temperature of 130°C. The winding temperature is the ambient temperature plus  $\Delta T$  or temperature rise, which is a function of choke power consumption.

## Minimum stray fields

Tridonic chokes are designed to keep stray fields at a minimum, thus enabling them to be used near sensitive equipment.

## National and international test marks

Tridonic chokes are approved by national and international test houses.

## Consistant high quality

Certified to ISO 9001, the production process and equipments guarantee a consistent high quality standard.

All finished goods are 100 % end of line tested and only the highest quality raw materials are used. Constant high quality is ensured by the use of fully automatic production.

## Special features of Tridonic chokes

- very short magnetic paths
- transverse lamination design with no stray field junctions
- compact windings
- short heat paths
- class H insulation
- vacuum impregnation
- long service life
- push in terminals for EC types
- screw terminals for UEC, LEC and OMC
- voltage 230 V 50 Hz or 240 V 50 Hz (other voltages on request)
- low power consumption
- maximum winding temperature  $T_w = 130^\circ\text{C}$
- fully automatic production with continuous tolerance test
- 100 % final testing, including continuity, short circuit, short to earth and operating values
- tropicalised

## Lamp matrix

### *Which ballast for what lamp?*

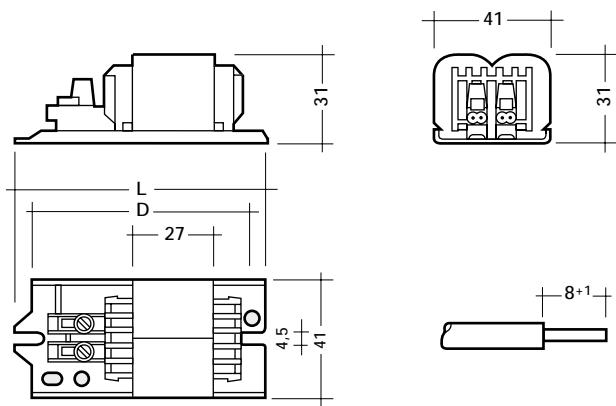

You can obtain the current lamp matrix

## Special baseplates for EC chokes

Tridonic ballasts are designed for standard fixing centres.  
For special requirements Tridonic also offers the following possibilities:

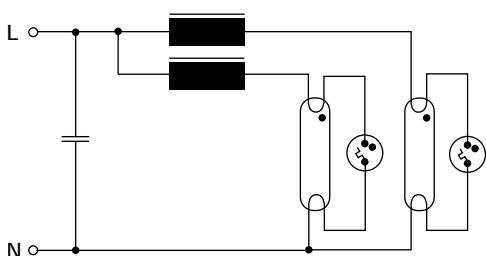

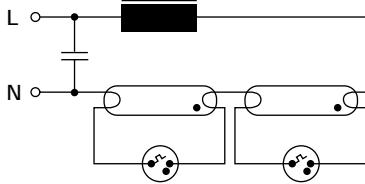

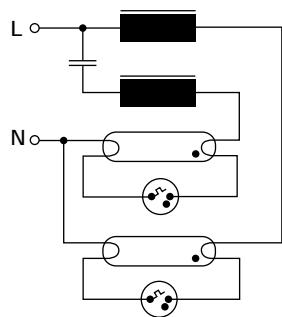

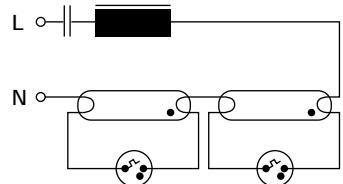

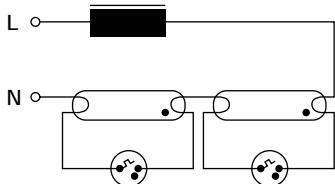

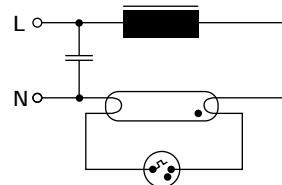

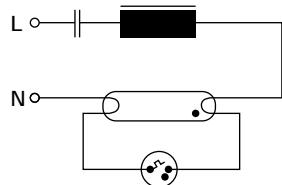

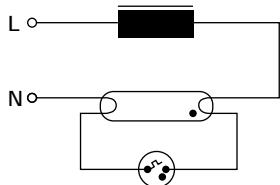

Type	Description					
	Standard			KU		
	L mm	D mm	drawing	L mm	D mm	drawing
EC .. 27	84,5	77	1	80	70	3
EC ... 50	151	140	2	110	100	1
EC ... 90	191	180	2	155	140	1

Other dimensions on request.

# Test marks, Standards and Symbols

Tridonic products comply with the requirements of EC Directives 89/336/EEC (EMC Directive) and 73/23/EEC (Low-Voltage Directive) and are entitled to bear the CE mark. EC declarations of conformity can be requested

- via the Internet at [www.tridonic.com](http://www.tridonic.com) – FAQ
- by sending an enquiry by e-mail to:  
hotline.tec@tridonic.co.at

The ENEC mark (European Norms Electrical Certification) is a European test mark and confirms that the device on which the symbol is shown complies with all the requirements of the ENEC test body. Tridonic test certificates can be requested

- via the Internet at [www.tridonic.com](http://www.tridonic.com) – FAQ
- by sending an enquiry by e-mail to:  
hotline.tec@tridonic.co.at

The device is suitable for mounting on standard flammable surfaces. Standard flammable surfaces include building materials such as wood and wood-based materials more than 2 mm thick.

The device is suitable to be installed in or attached to furniture whose behaviour in fire corresponds to standard flammable building materials within the context of DIN 4102 Part 1. The materials can be laminated, veneered or varnished.

The device is suitable for installing on or in furniture which is made from materials with unknown flammability properties.

Over temperature-protected ballast. Electronic ballasts from Tridonic contain devices to prevent overheating.

For example, corresponds to over temperature protection of 100°C across the whole surface of the ballast. The current values for the individual types are specified on the housing.
